The Spitzer Infrared Nearby Galaxies Survey (SINGS) Hubble Tuning-Fork

The Spitzer Space Telescope observed 75 galaxies as part of its SINGS (Spitzer Infrared Nearby Galaxies Survey) Legacy Program. The galaxies are presented here in a Hubble Tuning-Fork diagram, which groups galaxies according to the morphology of their nuclei and spiral arms. The designation of these galaxies and their placement in the diagram is based on their visible-light appearance. The main goal of the SINGS program is to characterize the infrared properties of a wide range of galaxy types. The images of the galaxies are composites created from data taken by IRAC (the Infrared Array Camera) at 3.6 and 8.0 μm , and MIPS (the Multiband Imaging Photometer for Spitzer) at 24 μm .

The infrared range probed by these and other observations taken for the SINGS project allows for the detailed study of star formation, dust emission, and the distribution of stars in each galaxy. Light from old stars appears as blue in the images, while the lumpy knots of green and red light are produced by dust clouds surrounding newly born stars. The elliptical galaxies on the left are almost entirely made of old stars, while spiral galaxies like our own Milky Way are rich in young stars and the raw materials for future star formation.

More information can be found at:
<http://sings.stsci.edu/>

Poster and composite images created from SINGS observations by Karl D. Gordon (Oct 2007)
 Blue=IRAC 3.6 μm (stars)
 Green=IRAC 8 μm
 (aromatic features from dust grains/molecules)
 Red=MIPS 24 μm (warm dust)

DATA

**drawn by Dr. Robert Hurt, in collaboration with
Milky Way experts based on data; as shown in
screenshot from AAS WorldWide Telescope*

The Radcliffe Wave

Each **red** dot marks a star-forming blob of gas whose distance from us has been accurately measured.

The Radcliffe Wave is **9000 light years long**, and **400 light years wide**, with crest and trough reaching **500 light years** out of the Galactic Plane.

Its gas mass is **more than three million times** the mass of the Sun.

João Alves, Catherine Zucker, Alyssa Goodman, Joshua Speagle, Stefan Meingast, Thomas Robitaille, Douglas Finkbeiner, Edward F. Schlafly, and Gregory Green 2020, *Nature* (7 January 2020)

Alves et al. Nature paper & two distance catalog papers by Zucker et al. (2019, 2020) include several interactive figures (via plot.ly & [bokeh](https://bokeh.org)), and deep links to data (on [Dataverse](https://dataverse.org)) and code (on [GitHub](https://github.com)) inspired by AAS “[Paper of the Future](https://www.aas.org/paper-of-the-future)” (Goodman et al. 2015)

"So What," for Astronomers?

demise of "Gould's Belt"

end to 100-year-old paradigm

"Local Arm" not shaped as we thought it was, locally

arm is "straight" from top-down

big wave in "arm" never previously observed

wave's origin unknown (collision? dark matter?
accretion?)

RADWAVE

Surprising

**wave-like
arrangement**

of star-forming
gas *is* the

"Local Arm" of
the Milky Way.

Open Questions

What is the **ORIGIN** of the Radcliffe Wave?
Collision?

Do other parts of the Milky Way show this wavy structure? How about other galaxies?
How can we **SEARCH**?

What do "waves" mean for the **STAR-FORMING HISTORIES** of galaxies?

SURF the Radcliffe Wave

It appears that the Sun, on its galactic orbit, crossed the Radcliffe Wave 13 million years ago, and may cross it again in the future.

SURF

THE RADCLIFFE WAVE

The Radcliffe Wave is a gigantic structure that defines the shape of the Sun's local neighborhood in the Milky Way Galaxy. Its existence was first presented officially in a paper published in *Nature* on January 7, 2020. This website offers scientists, educators, and the interested public much more information about the "RadWave," as we like to call it. Please use this page to find **publications** and **talks**, **visuals** (images, interactives, and videos), **history**, **team** info, **software**, and **data**. And, if we forgot something, just let us know—and we'll try to include it in future updates!
